

The new HTC-CCA / SP3991AA Center Channel Speaker includes an easy-to-install wiring harness that allows the soundbar to be used as a single Center Channel speaker in a multi-channel home theater system.

The included adaptor has been specially designed to combine the three separate channels soundbar allowing them to work as one single center channel speaker. Now you can get KEF's extraordinary sound performance and design aesthetics in a single Center Channel Soundbar that can be mounted on a wall or placed underneath your television or monitor.

1. Connect the Center Channel output of your amplifier or receiver to the positive (red) and negative (black) leads on the HTFc Center Channel Adaptor.

NOTE: There are two red leads on the input side of the adaptor; connect both red leads to the Center Channel output of your amplifier/receiver.

2. Connect the Adaptor to your Soundbar following the labels on the Adaptor.

* The Left and Right speaker channels in the Soundbar will play slightly lower than the Center speaker channel will when connected to the adaptor. This is normal and designed to perform in this manner.
