

Place the loudspeakers at the correct angle (ITU-R BS.775)

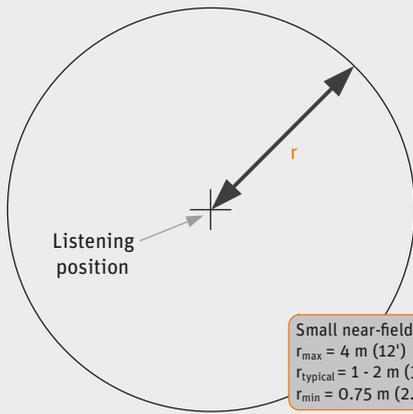

For 2-channel stereo use $\pm 30^\circ$

For 7.1 high definition systems (no international standards)

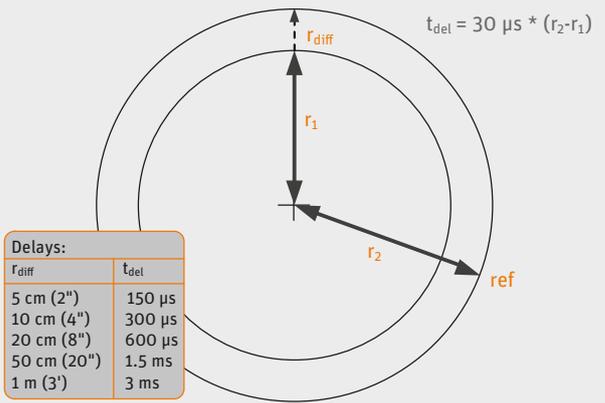

Place the loudspeakers at the same distance

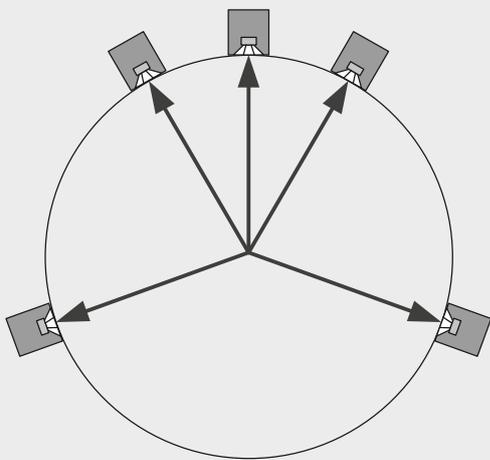

Small near-field systems:
 $r_{\max} = 4 \text{ m (12')}$
 $r_{\text{typical}} = 1 - 2 \text{ m (3 - 6')}$
 $r_{\min} = 0.75 \text{ m (2.5')}$

Delay closer loudspeakers by $30 \mu\text{s/cm}$ ($76 \mu\text{s/inch}$) Use the furthest loudspeaker a reference

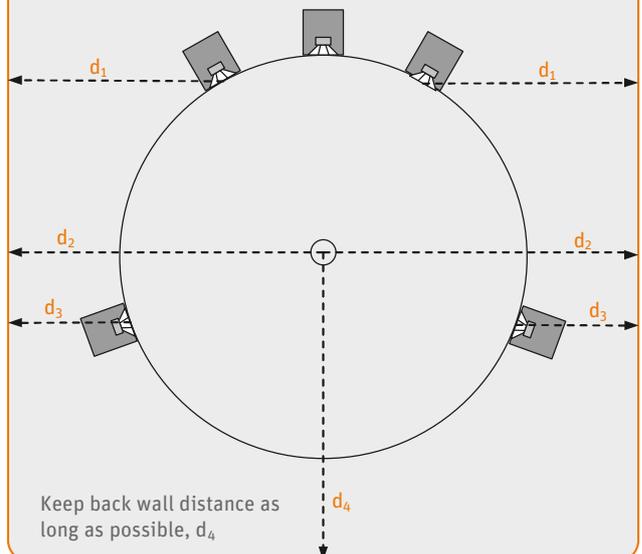

Horizontal: Point loudspeakers at listening position

Use the acoustical axis as a reference

Symmetrical loudspeaker and object placement in the room improves stereo imaging, d_1, d_2, d_3

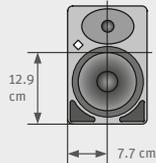

Keep back wall distance as long as possible, d_4

Getting Started Quickly

Acoustical axis and cabinet orientation

Use acoustical axis as a reference point

Recommended cabinet orientation for a wide usable listening area

Not recommended cabinet orientation, except for fixed listening positions

Acoustical controls

Autonomous operation

Near a desktop

Small: Low-Mid = -1.5 dB

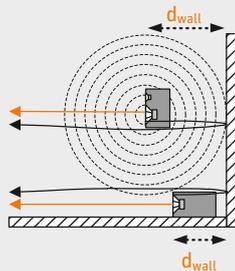

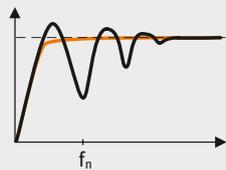

Medium: Low-Mid = -3 dB

Large: Low-Mid = -4.5 dB

Network controlled using "Neumann.Control"

- Download Neumann.Control software or app
- Use "Guided Alignment" to describe your room and installation and automatically set some acoustical controls
- Use "Manual Alignment" and an acoustic measurement system for more advanced control of the in-room response
- Use "Precision Alignment" for a fully automated alignment of your system (requires a Neumann Measurement Microphone)

Distance from the wall

Full Range Loudspeakers

Avoid $d_{wall} = 0.8 - 2.0$ m

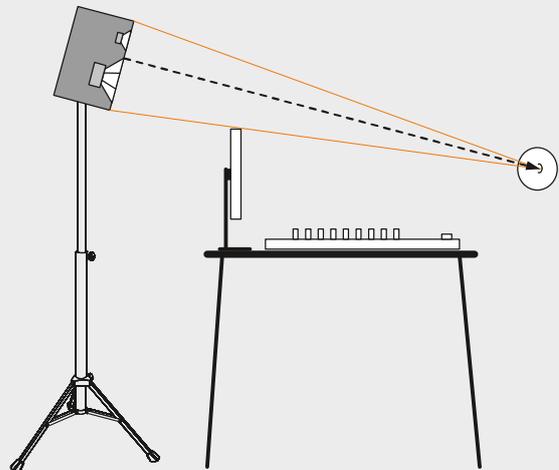

Bass Managed Loudspeakers

Avoid $d_{wall} = 0.8 - 1.0$ m

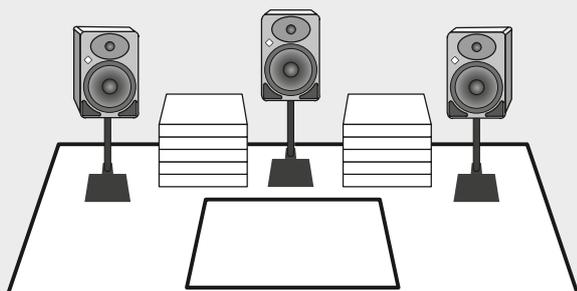

Subwoofers

Avoid $d_{wall} = >0.8$ m

Vertical plane: Point the loudspeakers at the listening position. Avoid objects between the loudspeaker and listening position.

Arranging the desktop: uncluttered and symmetrical

Avoid reflections for a smooth midrange
